## ABSTRACT

$\text{Hg}(\text{OTf})_2$  exhibits remarkable catalytic activity for the hydroxylative cyclization of 1,6-enynes. The present procedure should involve a sequence of mercuriation of a terminal alkyne, carbocyclization, hydration, and protodemercuration that regenerates the catalyst.

Carbocyclization is an important subject in modern organic synthesis,<sup>1,2</sup> and  $\alpha,\omega$ -enynes have been employed as the key substrate for transition metal ( $\text{Pd}$ ,<sup>3</sup>  $\text{Pt}$ ,<sup>4</sup>  $\text{Ru}$ ,<sup>5</sup>  $\text{Rh}$ ,<sup>6</sup>  $\text{Ir}$ ,<sup>7</sup>  $\text{Ti}$ ,<sup>8</sup> or  $\text{Ga}$ )<sup>9</sup> catalyzed alkene-exo mode cyclization. Mercuric salts have also been employed for enyne carbocyclization; however, stoichiometric amounts were used.<sup>10</sup> We have developed mercuric triflate  $\text{Hg}(\text{OTf})_2$  as a highly efficient olefin cyclization agent,<sup>11</sup> and its complex with an amine or

tetramethylurea (TMU) was employed for the synthesis of a variety of polycyclic natural products.<sup>12,13</sup> Recently, we discovered that  $\text{Hg}(\text{OTf})_2\cdot(\text{TMU})_2$  complex exhibits effective catalytic activity for the hydration of terminal alkynes to give

<sup>a</sup> GLC yield using hexadecane as an internal standard. <sup>b</sup> Reaction was carried out on a 0.5 M substrate concentration. <sup>c</sup> Reaction with 10 mol % of TfOH

methyl ketones in excellent yields.<sup>14</sup> The reaction should involve Hg<sup>2+</sup>-induced hydration of alkyne and subsequent protodemercuration<sup>10c</sup> by TfOH that is generated in situ. Thus, we expected the intervention of a cyclization step prior to the hydration and developed an efficient catalytic process to prepare exomethylene carbocycles. Although the mercuric salt catalyzed cyclization of  $\omega$ -alkynoic acids affording lactones is reported,<sup>15</sup> to our best knowledge the present protocol is the first mercuric salt catalyzed carbocyclization.

The reaction of prenyl propargyl ether **1** with 10 mol % of Hg(OTf)<sub>2</sub> in the presence of 5 equiv of water in CH<sub>3</sub>-NO<sub>2</sub>/CH<sub>3</sub>CN (9:1, 0.1 M concentration) at room temperature for 3 h afforded the exomethylene carbinol **2** in quantitative yield (Table 1, entry 1). The reaction should involve the vinyl mercury compound **3** as the intermediate, and the reaction with triflic acid, generated in situ, regenerates mercuric triflate, which establishes the catalytic cycle. A 5 or 1 mol % loading of catalyst was also enough to complete the reaction to give **2** in 99% yield within 5 and 16 h, respectively (entries 2 and 3). Even 0.1 mol % of Hg(OTf)<sub>2</sub> afforded **2** quantitatively within 30 h by conducting the reaction at 0.5 M substrate concentration (entry 4). When a 1:1 complex of Hg(OTf)<sub>2</sub> and TMU was employed, es-

<sup>a</sup> Reaction was carried out in the presence of 5 equiv of H<sub>2</sub>O. <sup>b</sup> One equivalent of H<sub>2</sub>O was used.

entially the same results were obtained (entries 5–7). However, the 1:2 complex afforded slightly lower yields (entries 8–10). Generally Hg(OTf)<sub>2</sub> is stable in the presence of H<sub>2</sub>O (although it is soluble and hygroscopic);<sup>11b,12b,c,e</sup> however, some people are suspicious about its decomposition to Hg(OH)<sub>2</sub> and TfOH and feel that it is probably the TfOH that brings about the reaction. Therefore, a control experiment

with 10 mol % of TfOH was performed, and it afforded none of the product **2** (entry 11) but an alkylation product (10%) as the only isolable material from a complicated mixture.<sup>16</sup>

The reaction of cinnamyl propargyl ether **4** with 1 mol % of Hg(OTf)<sub>2</sub> in the presence of 5 equiv of water in CH<sub>3</sub>-NO<sub>2</sub>/CH<sub>3</sub>CN (9:1) at room temperature for 20 h afforded the carbinol **5** as a 16:1 mixture of diastereomers in 85% yield. Treatment of geranyl propargyl ether **6** with 5 mol % of Hg(OTf)<sub>2</sub> provided carbinol **7** as a 20:1 mixture in 95% yield. Reaction of the homoprenyl propargyl ether **8** with 1 mol % of Hg(OTf)<sub>2</sub>, however, afforded six-membered ring ether **9** in only 13% yield, and the major product was the ketone **10** in 70% yield. Bishomoprenyl propargyl ether **11** did not afford any seven-membered ring product, and the ketone **12** was obtained in 92% yield by the reaction using 5 mol % catalyst. Dimethyl malonate derivative **13** afforded the cyclization product **14**; however, it required at least 10 mol % of catalyst to complete the reaction, probably as a result of chelation with the malonate residue. Reaction of **15** with 10 mol % of catalyst afforded the six-membered carbocycle **16** in 69% yield. However, the reaction was not as clean as the others, affording the isomeric carbinol **17** (6%) and the methyl ketone **18** (19%). On the other hand, the reaction of the enyne **19** with 10 mol % catalyst and 2 equiv of water afforded the lactone **20** in 86% yield along with the alcohol **21** (3%). The reaction of sulfonamide derivative **22** and 10 mol % of catalyst afforded the five-membered ring carbinol **23**, albeit in only 20% yield. Methoxybenzyl propargyl ether **24** reacted with 1 mol % Hg(OTf)<sub>2</sub> and 1 equiv of water to furnish the dimerization

product **25** in 70% yield, probably via acid-catalyzed dimerization of the primary product **26**. Reaction with 5 equiv of water, on the other hand, afforded only the hydrolysis product **27** in 85% yield. Thus, we have developed

a novel Hg(OTf)<sub>2</sub>-catalyzed hydroxylative carbocyclization to construct five-membered ring products in good to excellent yields via mercuration of a terminal alkyne, carbocyclization, hydration, and protodemercuration sequence regenerating the catalyst, Hg(OTf)<sub>2</sub>. The reaction is mild enough to be applied to a variety of substrates, and particularly, the observation of the equal applicability of the mercuric triflate–TMU complex allows a wider possibility to achieve the reactions of acid-sensitive substrates. The efficiency to construct six-membered rings from 1,7-enynes under Hg(OTf)<sub>2</sub>-catalysis is an unsolved problem, and we are currently exploring to find suitable conditions.
